

Kabuni - Ideum Project

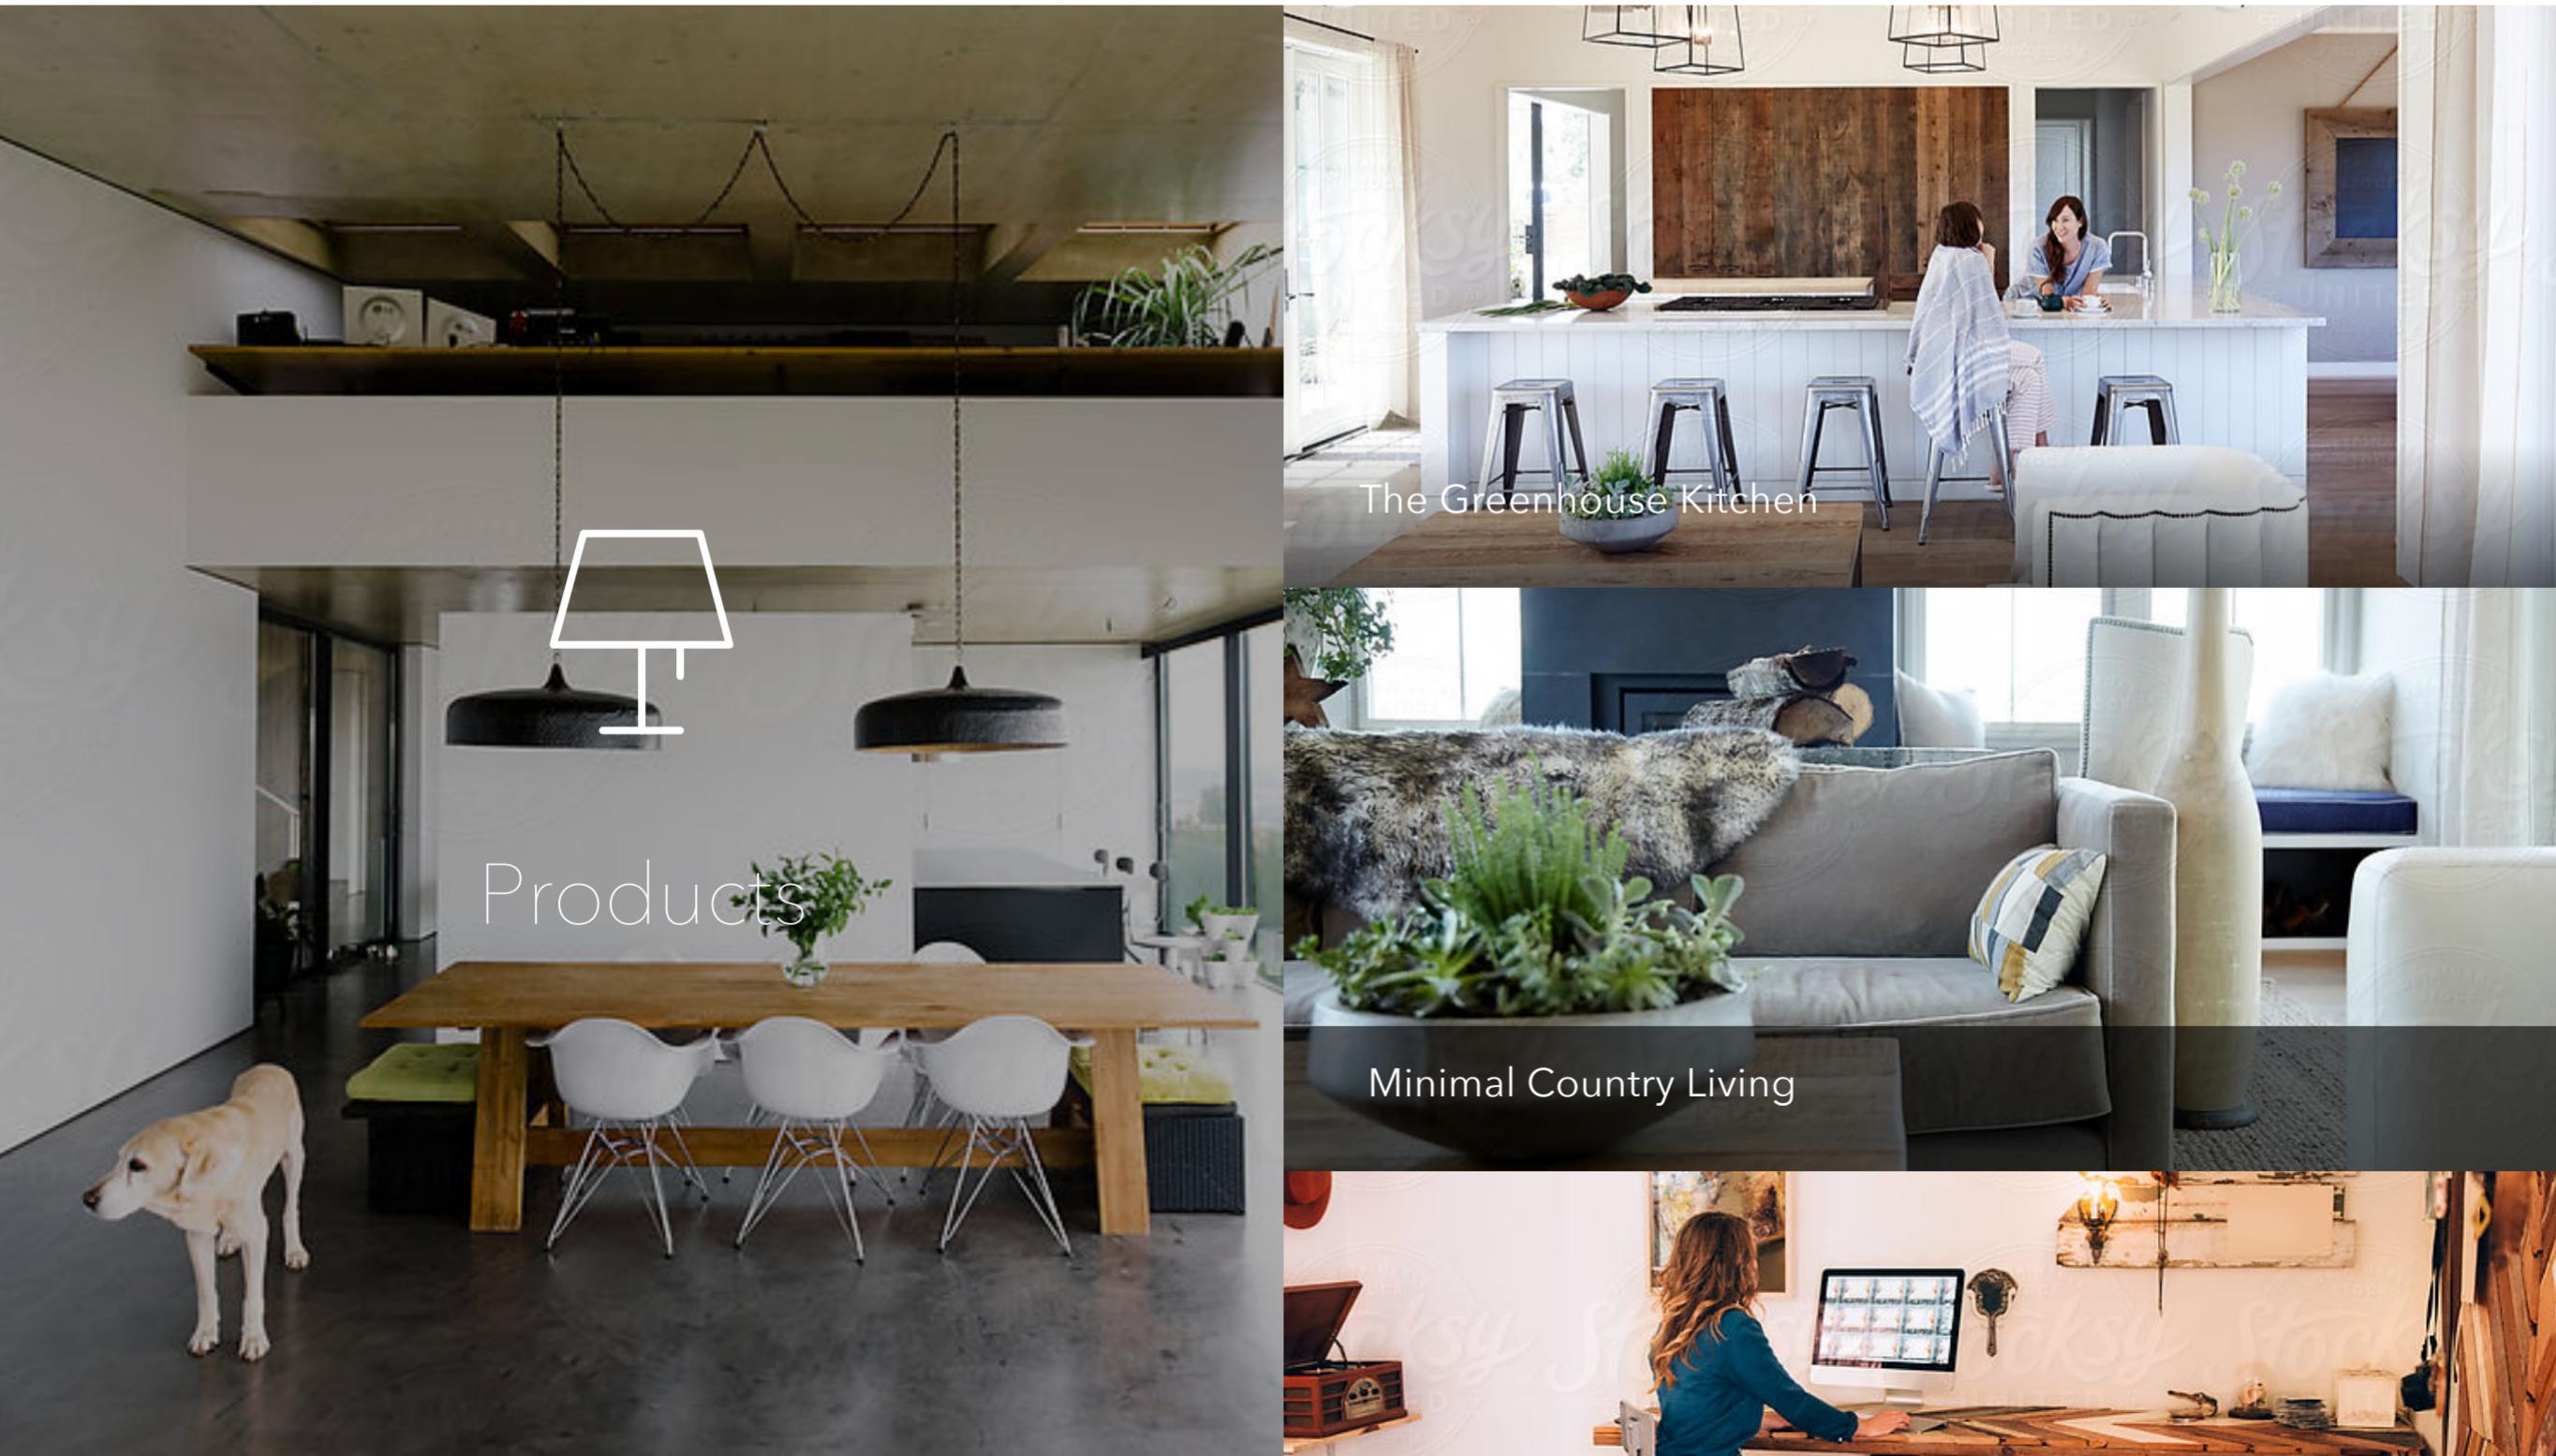

UX, Interaction Design, and Web Development @ Skyrocket Digital

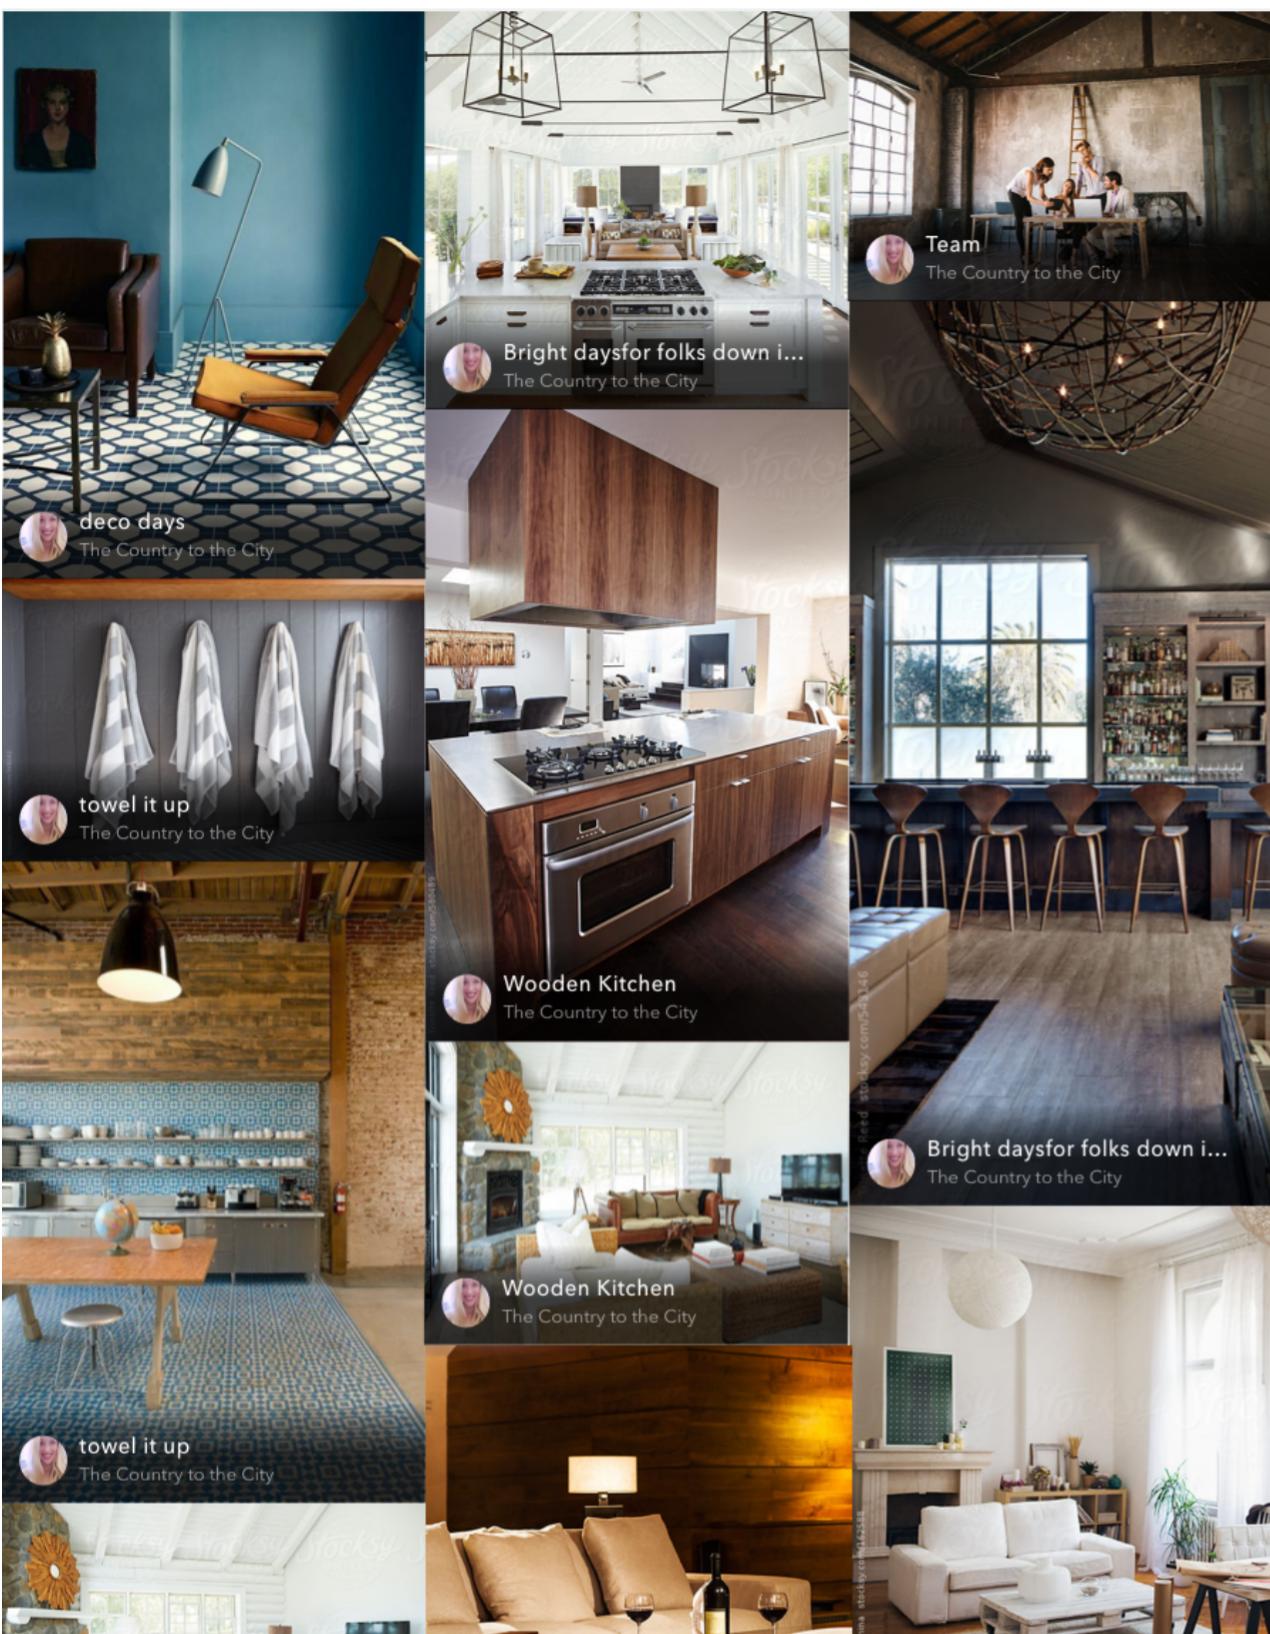

Kabuni is a community-driven marketplace for home designers, design lovers, and makers. As part of their physical brand experience, Kabuni wanted an interactive touchpoint that would get people interested in looking at their products and also as a tool that would interact with their mobile and web application. The Ideum interactive table was a large touch screen that doubles as a table. Using web technologies, I was tasked to create an interactive experience that would showcase their products by interacting with Kabuni's product API and using touch gestures to interact with their products.

The web app created for the project allows the user to browse through products and add them to their "mood boards". Users who already have accounts with Kabuni will see their accounts also updated by using the Ideum table web app.

Once someone logs in, they're greeted with their mood boards and the option to look at products.

Mood boards consists of images that a user can upload as inspirations and products that they have put in from the store. Taking advantage of the big screen, the uploaded images and products are scrollable vertically to allow for side by side comparisons of products.

When tapped, products pop up into dragable cards that can be passed around the table. You are able to view more detail, rotate, and zoom the card around the table.

Taking advantage of the big screen size and considering that the main mode of interaction is touch, the use of large imagery was not only aesthetically pleasing, but served as clear touchpoints of each product category.

Once someone has reached the products list, they may add those products into their mood boards that they've created by dragging and dropping.

A little checkmark and the scaling up of the rectangle provides feedback when a product is about to be dropped into a mood board.

The Ideum devices were configured in its table setting. This allows for multiple people to look and interact with the screen, as the table and the application are able to detect multiple touches at the same time. This also gives an affordance for those interacting with the table some space to work on, as they discuss their ideas.

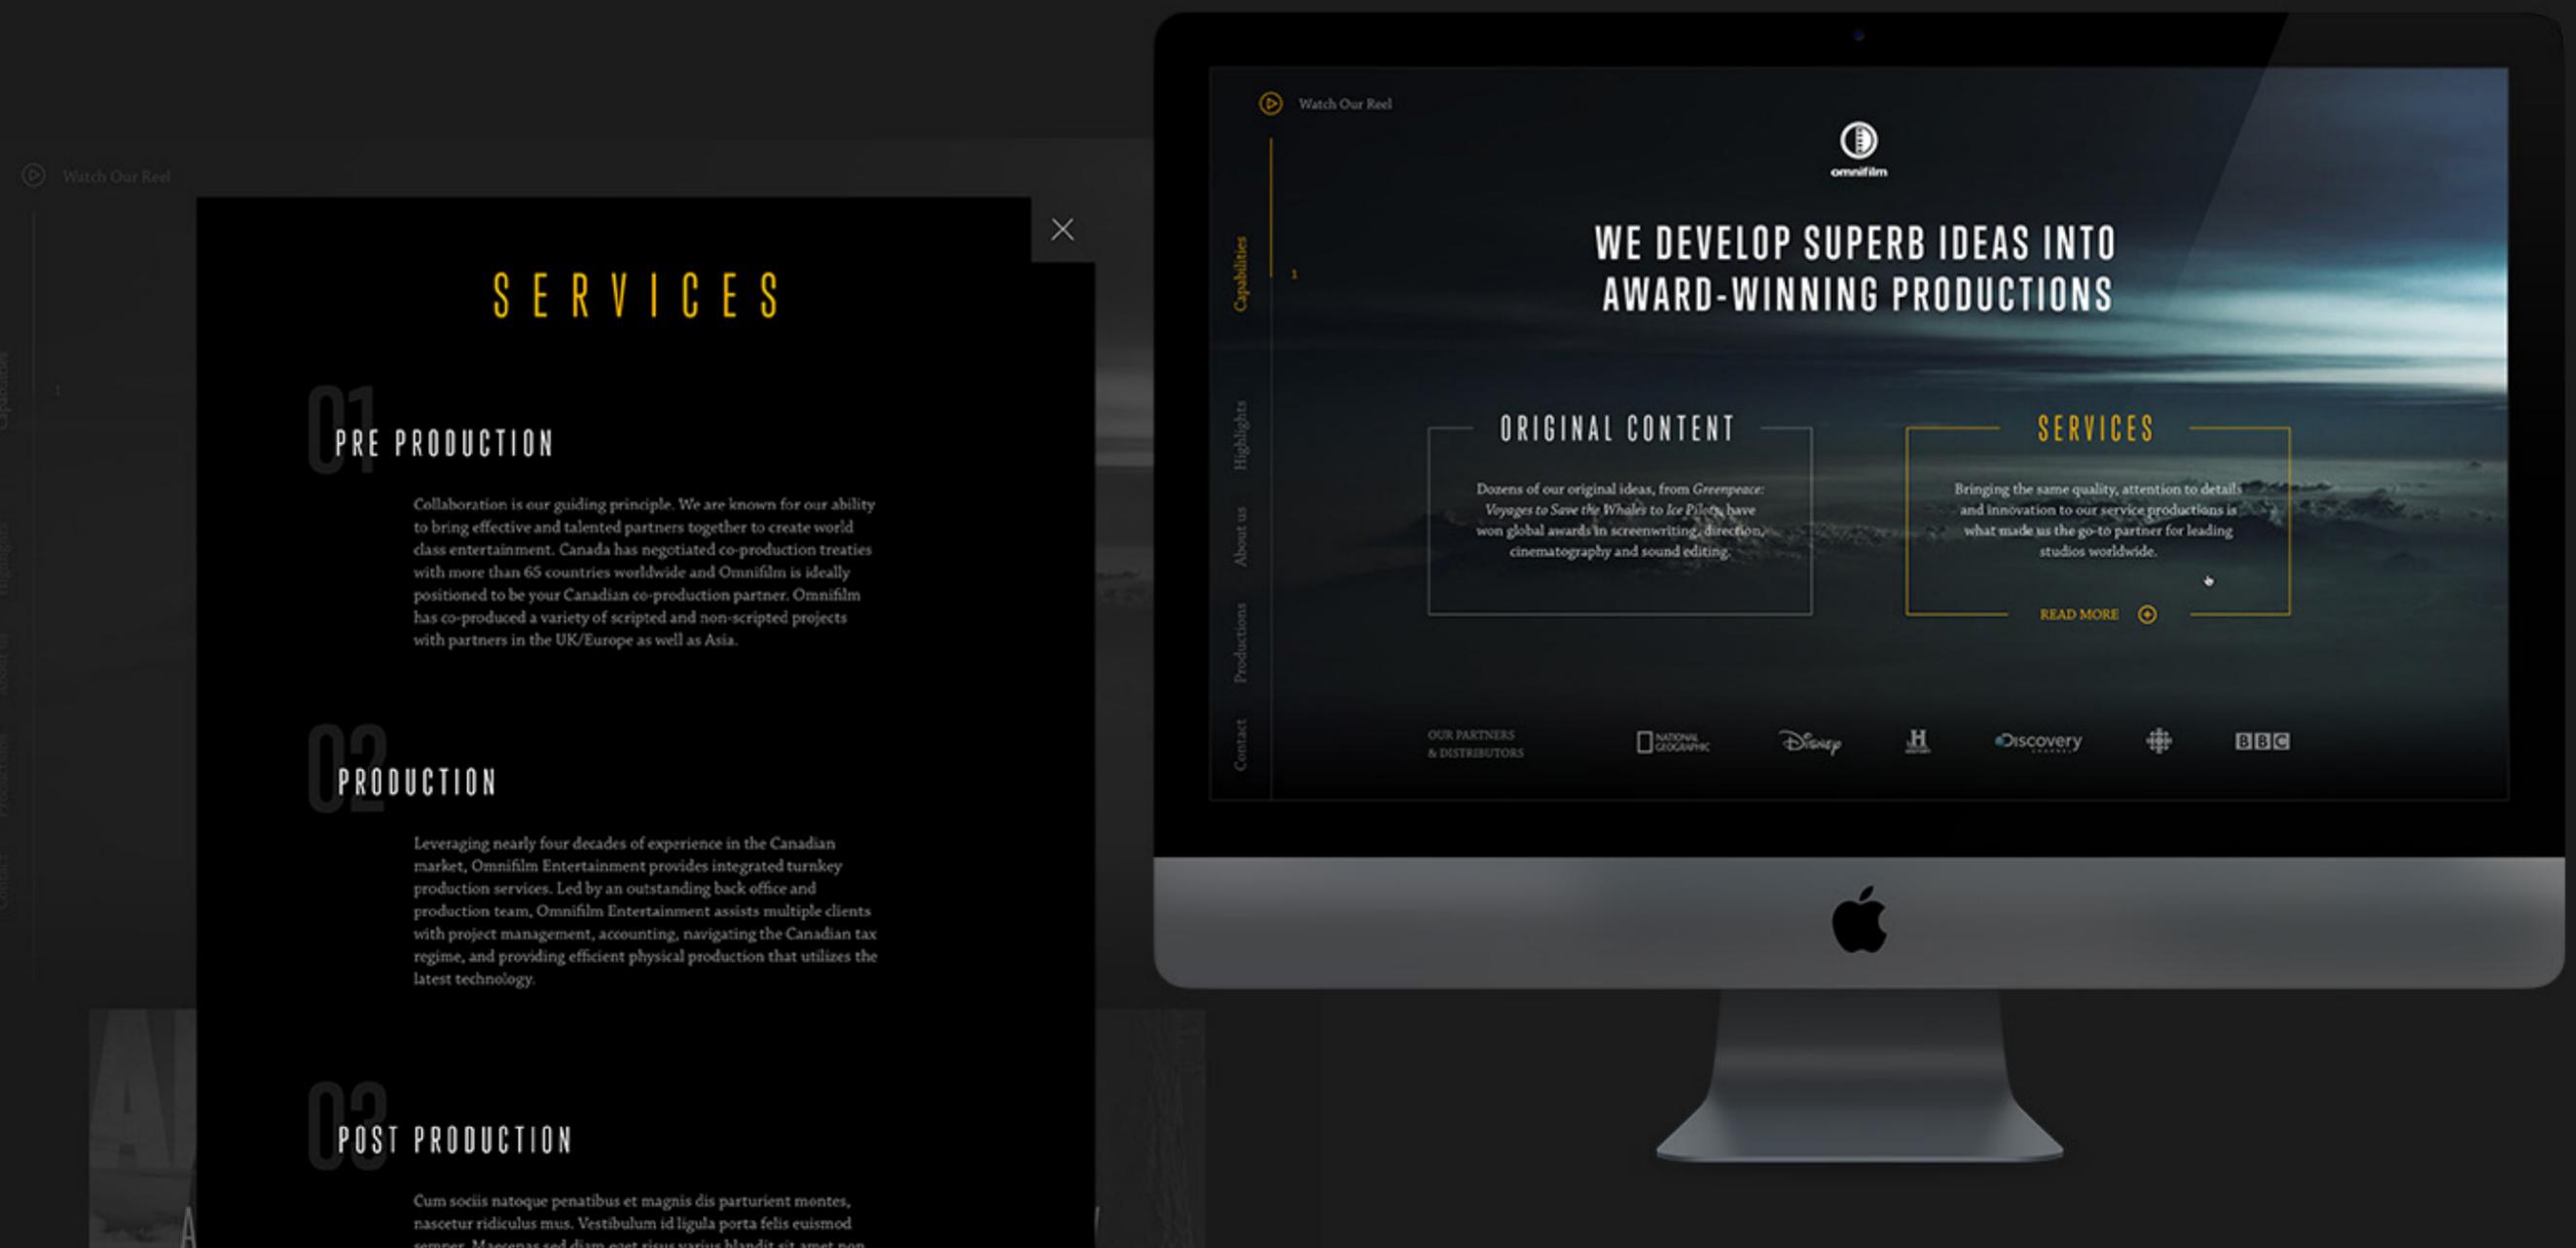

Omnifilm - Web Experience

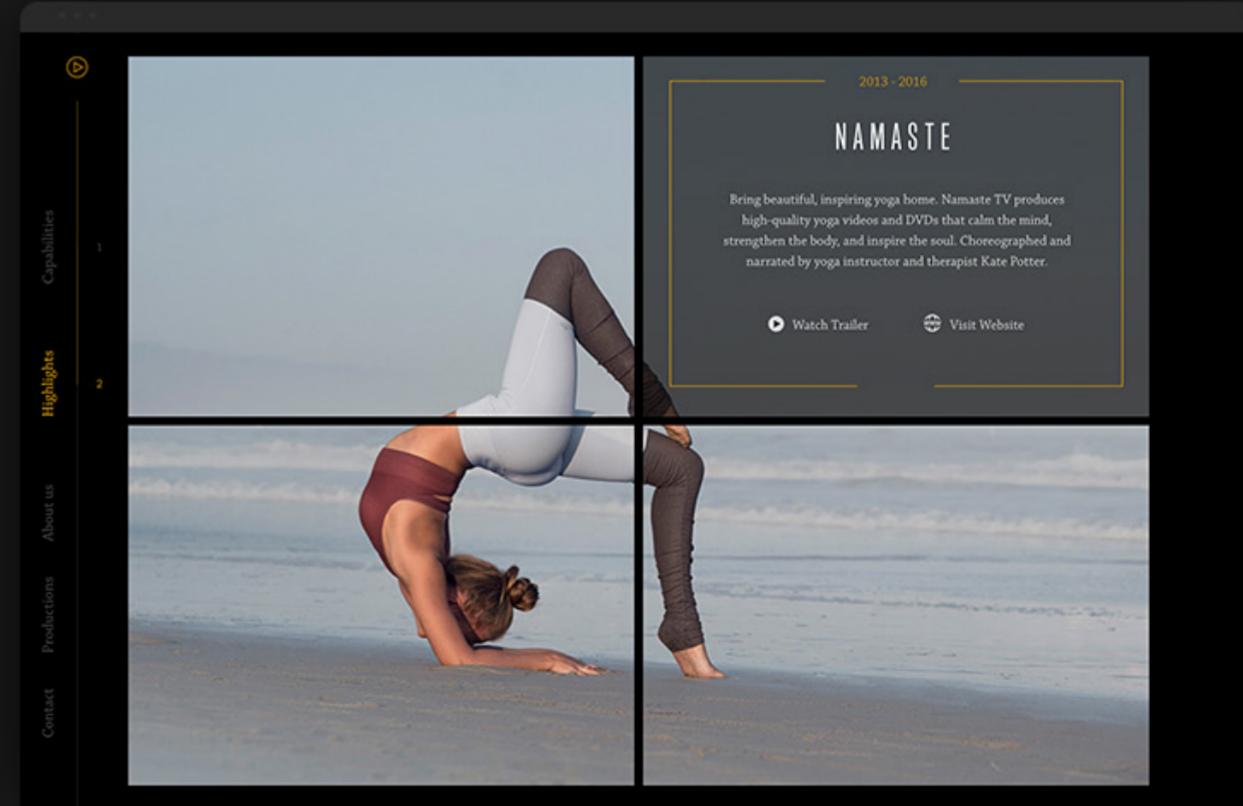

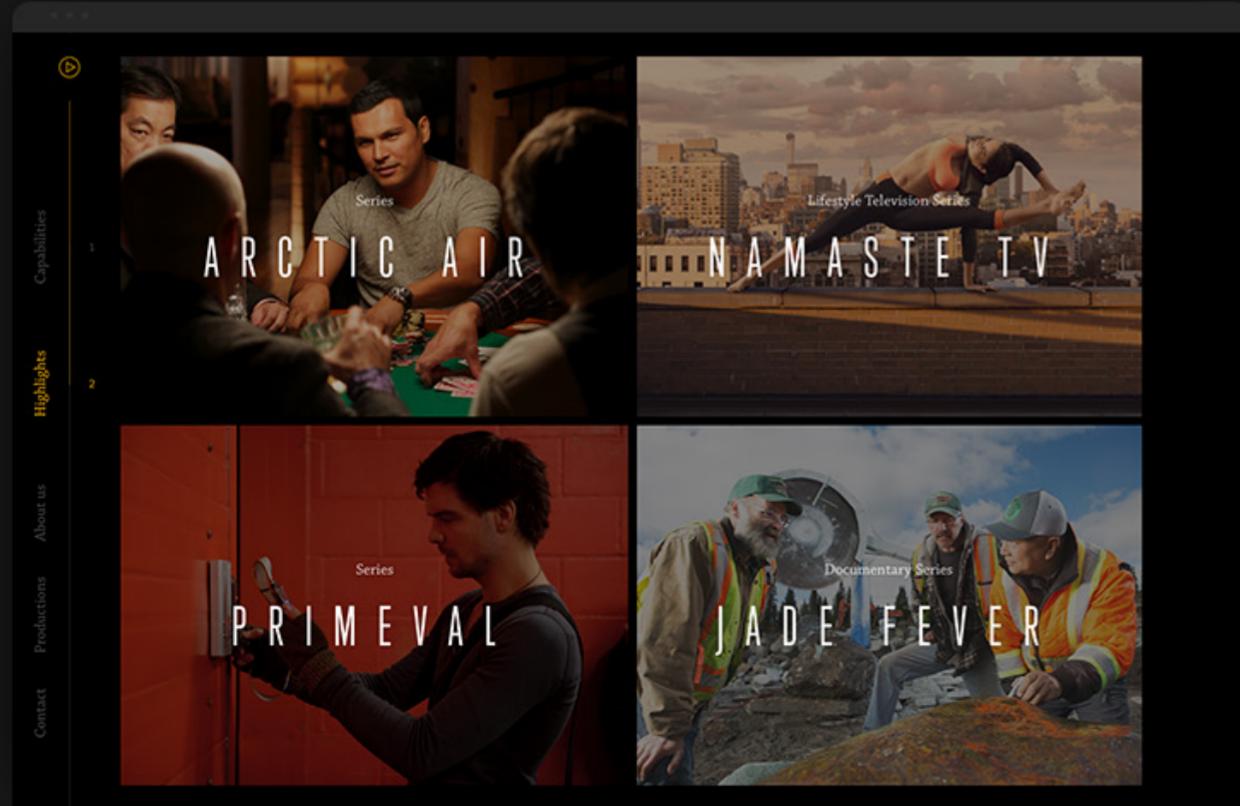

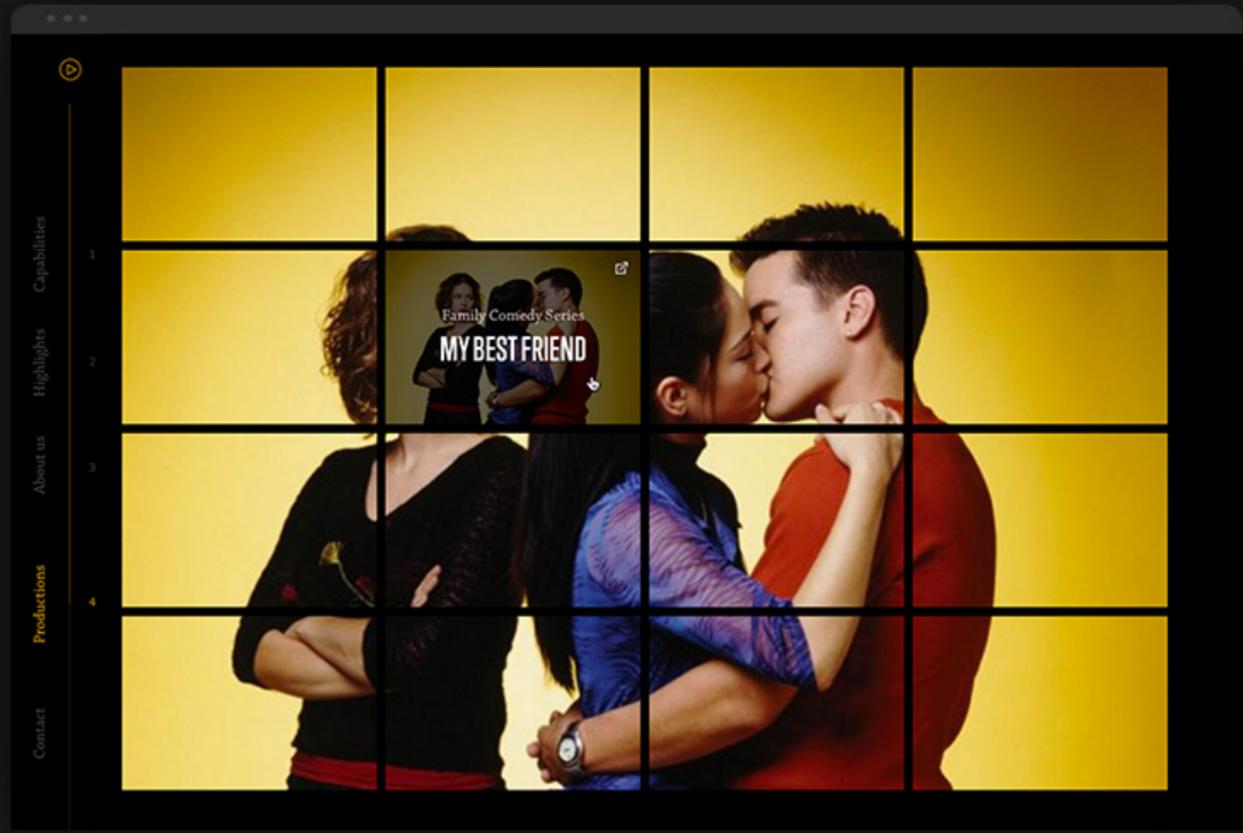

Web Development @ Skyrocket Digital

Omnifilm Entertainment came to Skyrocket Digital for help in unveiling the company's core through an insightful web experience. Omnidigital felt that their previous website did not properly convey their brand and did not tell their story. I was part of the web development team at Skyrocket that helped in delivering the new web experience, which included both front-end and backend capabilities. Responsibilities included general styling and the handling of backend data in the front-end using Angular 2 as a framework.

Sexyhair Community - Web App Experience

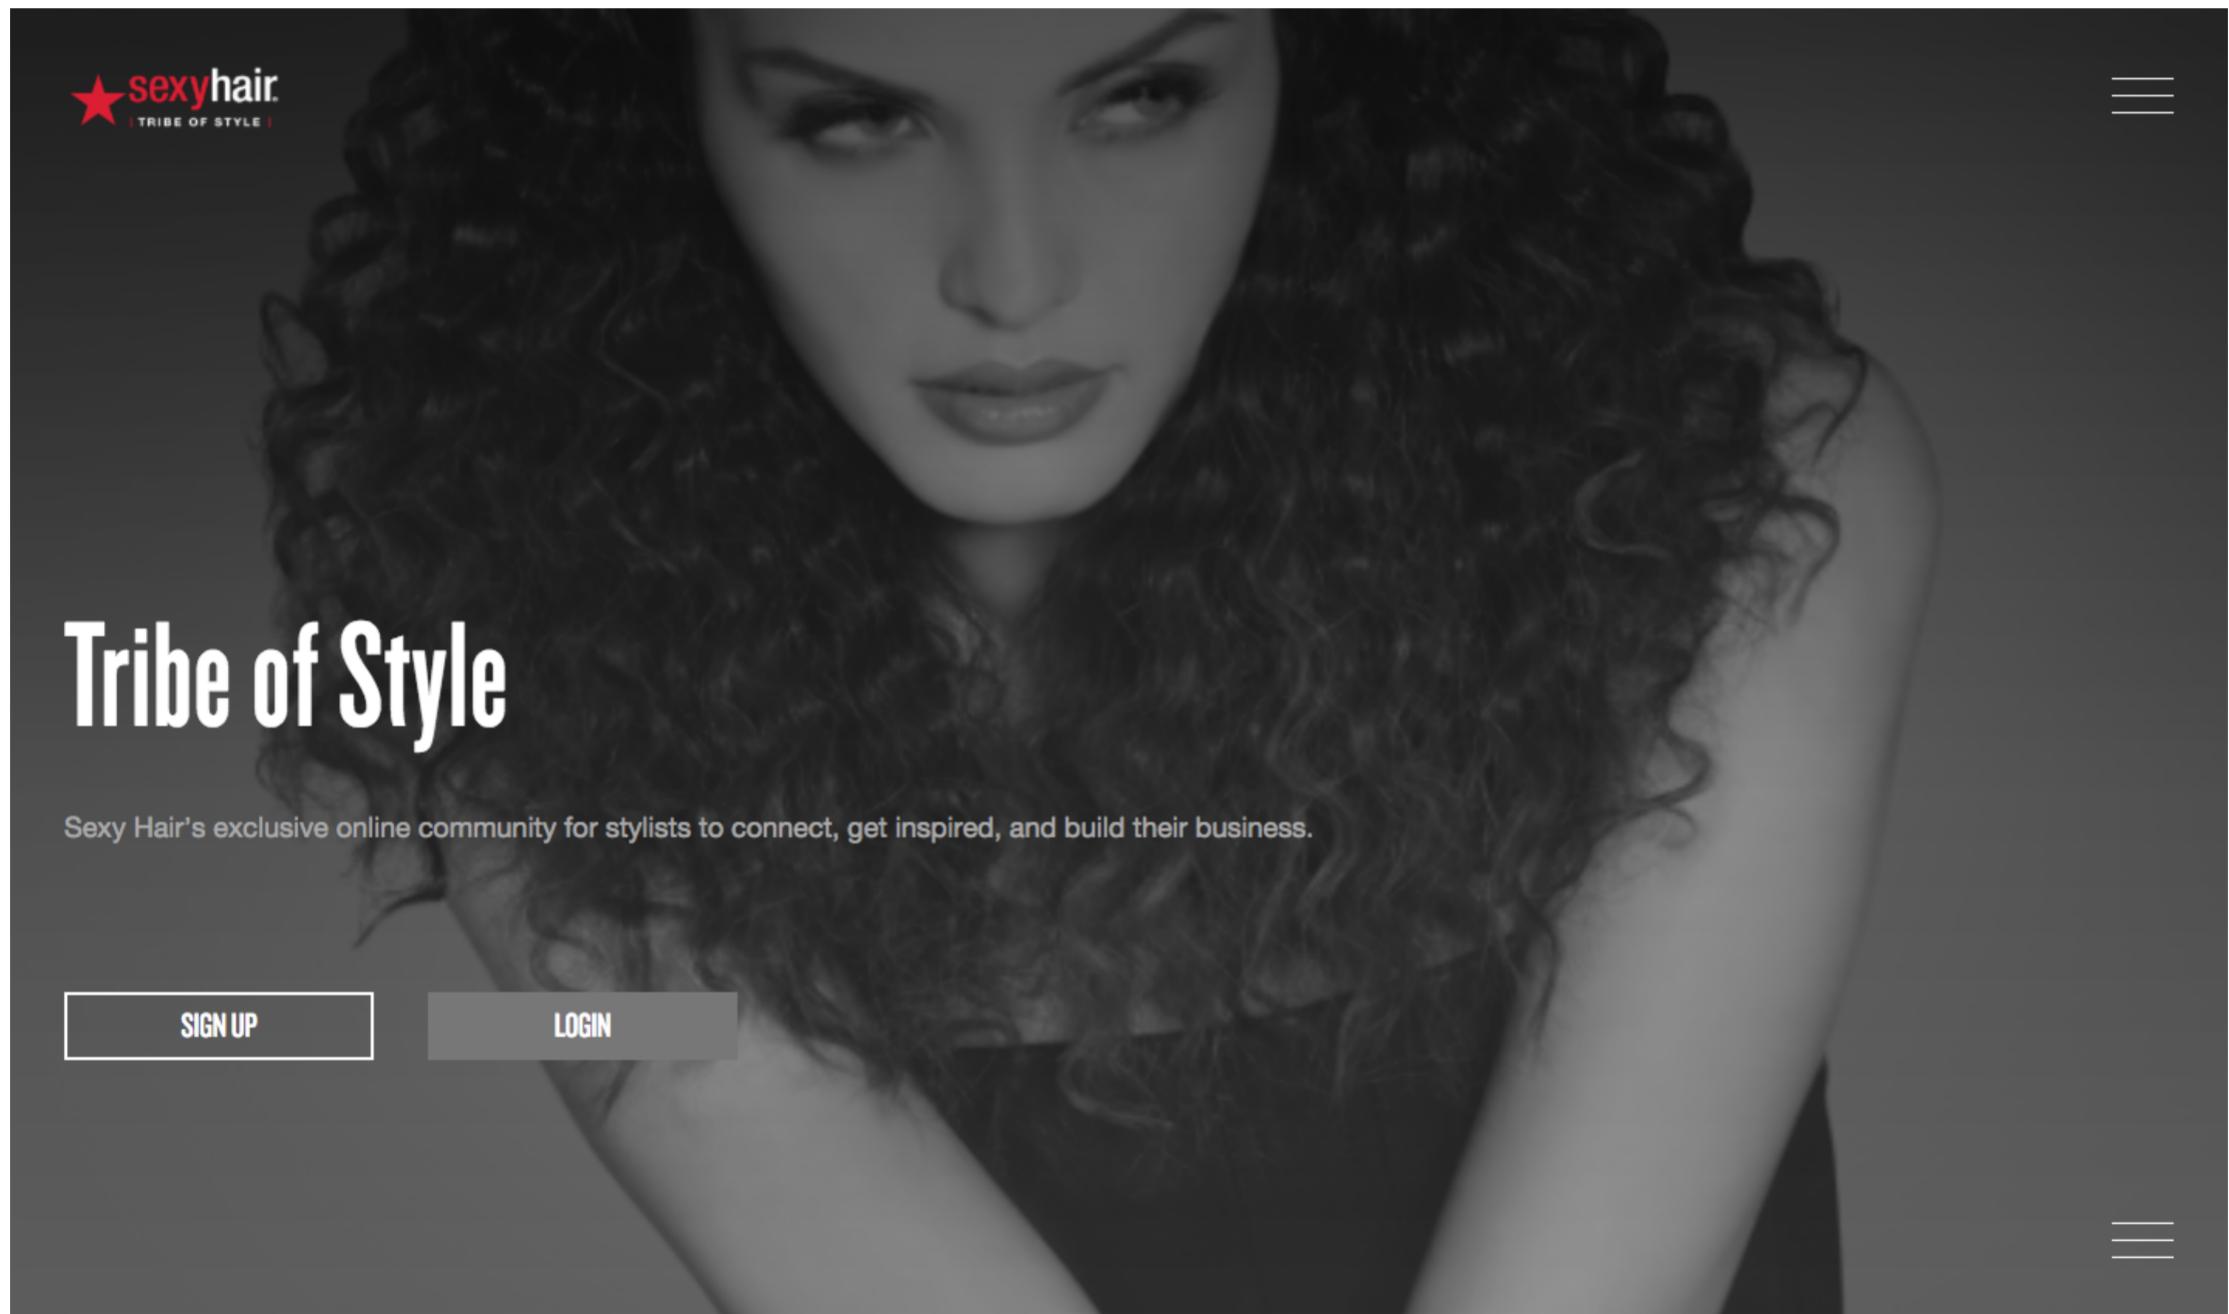

Web Development @ Skyrocket Digital

Sexyhair, a hair products company, asked Skyrocket Digital to help them create a web community experience. They required a place where they can share their instructional videos, have different membership tiers to access those videos, and a place where members can post and share their work.

Responsibilities included general styling, the handling of backend data in the front-end using Angular 2 as a framework, some backend and database programming.

Check out the web experience at <https://community.sexychair.com/>
